

## **Improve the workflow of X ray images acquisition and interpretation efficiency thanks to Konica Minolta`s Aero DR3/CS-7 solution.**

Balimed Hospital was founded in 2008. This hospital is a referral hospital for 3 areas on Bali island that's Badung Regency, Tabanan Regency, and Denpasar Regency. Balimed Hospital with a capacity of 100 beds and supported by 129 specialists is located at Jalan Mahendradatta no 57X Denpasar, Bali. Health service in Balimed Hospital operated by 138 specialist and 15 general practitioners and hundreds of employees in the various health field.

BaliMéd Hospital used to use CR(Computed Radiography) but it decided to adapt DR(Digital Radiography) due to the deep consideration for the patients.

Ms.Cili Savitri radiograher appreciates about the improvement of her workflow and is saying that

Aero DR has unique feasures such as 100 µm pixel size and new imaging processing technology "REALISM" can create clear images especially for chest and spine as well as for fracture cases because it can show more details and eventually the intepretation of image becomes more efficiency.

High DQE can help to reduce X does amount a lot compare to CR that is really good point for patients.

Lightweight and robust structure can last DR`s lifetime as longer as possible and Powered by a lithium ion capacitor is to reduce the battery changing cost that is really good for financial point of view.

Internal access point & internal storage(Aero Strage) allow to bring the detector outside of radiology room without PC. That is helping to create wonderful workflow.

It is also great that Aero storage function can save 100 images inside the detector.

After Covid 19 is over, Aero DR3 can support more patient diagnosis by the environement of point of view such as low X does exposure compare to CR.
